

### AMENDMENTS TO THE CLAIMS

1. (Currently amended) A motion based multimedia I/O system for communicating bidirectional communication of information between one or more applications in a computer and a user, further comprising:  
  
an I/O device, further comprising:  
  
at least one movable figure having a preselected ornamental appearance;  
  
a base unit having a universal adapter for removably attaching the movable figure;  
and  
  
the base unit having means to control movement of the movable figure;  
  
[[a]] the movable figure having means to move under control of the base unit in response to instructions from a computer, the instructions from the computer issued from one or more independent programs through a common interface;  
  
~~a speaker, electrically attached to the movable figure, for outputting audio data from the computer; and~~  
  
~~a microphone, electrically attached to the movable figure, for inputting voice data to the computer;~~  
  
whereby the motion based multimedia I/O system acts as an intermediary a shared communications device between one or more independent software programs in a computer and an individual that communicates bidirectionally with those programs via audio output, voice input, and visual motion output.

2. (Currently amended) A system, as in claim 1, wherein:

the ~~movable figure~~ base unit communicates with the computer via a wireless link.

3. (Canceled) A system, as in claim 2, wherein:

the movable figure further comprises a base unit and a movable figure.

4. (Currently amended) A system, as in claim 1, wherein:

the ~~movable figure~~ base unit is remotely located from the computer.

5. (Currently amended) A system, as in claim 4, wherein:

~~movable figure~~ the base unit communicates with the computer over a network.

6. (Currently amended) A system, as in claim 5, further comprising:

the ~~movable figure~~ base unit transmits voice data to a computer over a network.

7. (Original) A system, as in claim 6, further comprising:

means to select a voice from a voice data set and substitute the selected voice for the input voice data.

8. (Original) A system, as in claim 1, further comprising:

means to select a voice from a voice data set and substitute the selected voice for the input voice data.

9. (Previously amended) A system, as in claim 8, further comprising:
- means to store user voice data into the voice data set; and
- means to output the user's voice data from the voice data set to the speaker.
10. (Canceled) A system, as in claim 3, further comprising:
- a base unit, having means to removably attach to the movable figure, and further having means to movably control the motion of the movable figure; and
- the movable figure having means to attach to the base unit.
11. (Canceled) The A system, as in claim 1, wherein the movable figure communicates directly with the computer.
12. (Currently amended) A system, as in claim 1, wherein:
- the multimedia I/O device can be automatically activated by the computer to provide programmed alarms, predetermined events, and/or timed messages.
13. (Currently amended) A multimedia I/O system for communicating with a computer, further comprising:
- a common software interface configured to accept instructions from one or more independent programs in a computer;
- a plurality of multimedia I/O devices, each multimedia device further comprising:

motion output means, having means to communicate via motion;

a speaker, electrically attached to the movable object, for outputting audio data; and

a microphone, electrically attached to the movable object, for inputting voice data to a computer;

whereby the multimedia I/O devices act as intermediary communications devices that communicates allow communication between multiple programs and a user via audio output, voice input, and motion.

14. (Original) A system, as in claim 13, wherein:

each of the multimedia I/O devices communicates directly with the computer.

15. (Original) A system, as in claim 13, further comprising:

at least one base unit, the base unit having means to attach to a multimedia I/O device;

the base unit communicates further comprises a wireless communications link.

16. (Original) A system, as in claim 14, wherein:

at least one of the plurality of multimedia I/O devices is located at a remote location from computer.

17. (Original) A system, as in claim 13, wherein:

the multimedia I/O device outputs notification of system events, including e-mail, incoming user messages, system status messages, and scheduled messages.

18. (Original) A system, as in claim 13, wherein:

the multimedia I/O device is used as a movable game figure in conjunction with software games.

- 19 (Original) A system, as in claim 13, wherein:

the multimedia I/O device is used to represent individuals in a chat room.

20. (Original) A system, as in claim 18, wherein:

movable multimedia I/O devices are used to represent individual players in multiplayer games.

21. (Currently amended) A multimedia I/O system for communicating information between a computer and a user, further comprising:

a computer having a programmable processor and storage means for storing ~~at least one~~ computer ~~program~~ programs;

~~[[, the]]~~ at least one computer program further having means to execute programming instructions to a base unit for controlling a movable figure;

~~[[a]]~~ the base unit having a removably attached movable figure, the base unit further having means to control movement of the movable figure having motion means ~~having means to move under control of the computer program~~;

a common interface between the programmable processor and the base unit having a predetermined interface format which allows multiple computer programs to independently access the base unit and control movement of the movable figure; and

~~a speaker for outputting audio data under control of the computer program;~~

whereby the multimedia I/O system acts as an intermediary communications device between one or more independent software programs in a computer program and an individual that communicates information via ~~audio output and~~ movable figure motion output.

22. (Currently amended) A system, as in claim 21, further comprising:

an interface for communicating between computer programs and the ~~movable figure~~ base unit, for receiving output audio data for output by the speaker and for receiving instructions from the computer programs for controlling movement of the movable figure.

23. (Currently amended) A system, as in claim 22, further comprising:

a microphone for inputting audio data;

means to transfer the input audio data to a computer program via the interface; and

the computer program having means to respond to the input audio data by outputting audio data and instructions to the base unit for controlling movement of the movable figure;

whereby the user can interact with a computer program by inputting audio data to the computer program, and receiving audio and motion output from the computer program.

24. (Currently amended) A system, as in claim 23, further comprising:

communication means in the computer to communicate with a network of computers, the communication means further having means to receive software instructions from remote computers for controlling the base unit motion and for activating the movable figure and for inputting and outputting data by the movable figure and for inputting and outputting data to the movable figure via the base unit.

25. (Currently amended) A system, as in claim 23, further comprising:

means to automatically output audio data and/or activate the base unit to move the movable figure when a preselected event is detected.

26. (Original) A system, as in claim 25, wherein:

the preselected event is a system error, a timed event, or an alarm.

27. (Currently amended) A system, as in claim 23, further comprising:

voice data collection and storage means to store a variety of voice data types from a variety ~~[[or]]~~ of sources;

means to select voice data stored in the voice data collection and storage means by entering voice commands into the microphone, and outputting the selected voice data via the speaker.

28. (Canceled) A system, as in claim 10, wherein:

the speaker and the microphone are integrated into the base unit.

29. (Currently amended) A system, as in claim ~~[[10]]~~ 21, wherein:

the ~~multimedia I/O device~~ movable figure includes attachment means to attach to the a universal adapter for attachment to in the base unit;

the base unit includes a universal adapter, which ~~corresponds to the universal adapter attaches to attachment means on the multimedia I/O device, for attachment to a multimedia I/O device~~ movable figure; and

the ~~universal adapter on attachment means in the multimedia I/O device~~ movable figure is removably attached to the universal adapter on the base unit such that the base unit can be attached to different ~~multimedia I/O devices~~ movable figures;

whereby the base unit and the ~~multimedia I/O device~~ movable figures have mutually corresponding and detachable universal adapters which allow different ~~multimedia I/O devices~~ movable figures to be interchangeably used in conjunction with a single base unit.

30. (Original) A system, as in claim 21, further comprising:

a manual input device, mainly a game controller, a joystick, a mouse, or a keyboard for inputting data to the computer for controlling the multimedia I/O device.

31. (Original) A system, as in claim 18, further comprising:

monitoring means to monitor user activity to determine if a specific instruction has been entered, if a specific event has occurred, or if a predetermined time period has been exceeded; and

means to automatically activate a predetermined response under control of the monitoring means if the specific instruction was entered, if the specific event occurred, or if the predetermined time period was exceeded.

32. (Original) A system, as in claim 23, further comprising:

means to input voice data to the microphone associated with the multimedia I/O device;

means to output the voice data to a speaker associated with a second multimedia I/O device.

33. (Currently amended) A system, as in claim 1, further comprising:

a base unit having means to receive electronic data and convert it to holographic data, a holographic data input to holographic projection means for projecting a holographic image; and

the movable figure is the holographic image.

34. (Currently amended) A method of using motion to communicate information between computers and individuals, including the steps of:

using a computer to control using a plurality of independent software applications to control an I/O device, which has movable components, the software applications controlling the I/O device via a common interface having a predetermined interface format which allows the software applications to independently access the movable figure [[and]] for the purpose of conveying information via specific controlled movements of the I/O device, the movable I/O device is positioned in view of an individual such that the movements are visible to the individual; and

associating specific events with specific movements such that when the individual observes a particular movement, information regarding a specific event is provided by the computer to the individual;

whereby an individual can be notified of specific events by a plurality of software applications in the computer based on particular movements of the I/O device which are controlled by the computer.

35. (Original) A method, as in claim 34, including the additional steps of:

using an I/O device which is structured to resemble a known character; and

moving portions of the I/O device in a manner similar to the normal movement of the known character;

whereby the behavior of the known character can be mimicked by the I/O device.

36. (Currently amended) A method, as in claim 35, including the additional steps of:

structuring the I/O device to resemble known characters ~~such as a human, an animal, a cartoon character, a robot, or a machine~~ including humans, animals, cartoon characters, robots, or machines; and

moving the I/O device such that movements of the I/O device resemble movements related to specific behavioral states, ~~such as~~ including humor, sadness, excitement, relaxation, anger, or concern of the particular known character mimicked by the I/O device;

whereby the behavior of known characters can be mimicked to convey information.

37. (Currently amended) A method, as in claim 36, including the additional step of:

selecting the motion used by the I/O device from a plurality of motions based on preselected factors ~~such as the length of time the individual takes to respond to a previous motion, the quality of a previous response by the individual to the computer, or the importance of a specific event;~~

whereby the computer can alter the motions used for a particular specific event or expected input based on preselected factors ~~such as the amount of time taken to respond by the individual, or the importance of the event.~~

38. (Original) A method, as in claim 37, including the additional step of:

providing audio output from the I/O device, under control of the computer, and coordinating motion data with audio data in a single communication;

whereby the I/O device more closely resembles the known character represented by the I/O device.

39. (Currently amended) ~~[[The]]~~ A method, as in claim 38, including the additional steps of:

using a microphone to input audio data from the individual to the computer; and

using voice recognition software in the computer to analyze the audio data input by the individual and respond to instructions or data contained in the audio data;

whereby the individual can issue commands, or enter data, to the computer via the microphone.

40. (Currently amended) A method, as in claim 39, including the additional [[step]] steps of:

remotely locating the movable I/O device in a remote location from the computer, to allow remote communication between a computer and an individual; and

using a wireless connection between the I/O device and the computer such that the user can move the I/O device from one location to another and remain in communication with the computer;

whereby the individual can carry the movable I/O device from one location to another and remain in communication with the computer.

41. (Original) A method, as in claim 40, including the additional step of:

using a plurality of movable I/O devices, each associated with an individual, located in remote locations from the computer and portable such that each individual can carry the individual's respective I/O device from one location to another to allow remote communication between multiple individuals via the computer.

42. (Original) A method, as in claim 41, including the additional steps of:

storing, in an audio data library, a plurality of selectable unique audio data, including voice data; and

selecting and outputting portions of the unique audio data;

whereby the unique audio data is output by the I/O device.

43. (Original) A method, as in claim 42, including the additional step of:

storing voice data from the individual in the audio data library, and selecting and outputting portions of the voice data to the I/O device;

whereby the individual's voice is output from the I/O device.

44. (Currently amended) A method, as in ~~claim~~ claim 39, including the additional step of:

using a plurality of movable I/O devices, located in remote locations from the computer, to allow remote communication between a computer and a plurality of individuals.

45. (Original) A method, as in claim 39, including the additional steps of:

playing a game on a computer; and

using the I/O device to represent a character from the game;

whereby the I/O device can communicate directly with the individual for the character in the game.

46. (Currently amended) A method, as in claim 39, including the additional steps of:

attaching a computer to a network of computers having at least one remote computer;

attaching multiple I/O devices to the computer, and having at least one of the I/O devices ~~represents~~ represent an individual on the remote computer; and

controlling, via the remote computer, the motion and audio output of the I/O device that represents the individual using the remote computer;

whereby multiple remote users can have individual I/O devices on the computer which allows them to produce motion data on the local computer.

47. (Currently amended) A method, as in claim 39, including the additional steps of:
- attaching a computer to a network of computers having at least one remote computer;
- attaching multiple I/O devices to the computer, and having at least one of the I/O devices ~~represents~~ represent a remote computer; and
- outputting motion data from the remote computer to the I/O device via the network that represents system events on the remote computer;
- whereby the remote computer can control motion on the I/O device.

48. (Original) A method, as in claim 35, including the additional steps of:
- playing a game on a computer; and
- using the I/O device to represent a character from the game;
- whereby the i/O device can communicate directly with the individual for the character in the game.

49. (Currently amended) A method of communicating [[with]] between computers and individuals, including the steps of:

using a portable I/O device as an interface between a computer and an individual such that the computer can output information to the individual, and the individual can input data to the computer; and

providing a wireless link between the computer and the portable I/O device such that the portable I/O device can be remotely located from the computer;

whereby an individual can control and interact with the computer using a portable I/O device, and can move the portable I/O device from one location to another while controlling and interacting with the remotely located computer.

50. (Original) A method, as in claim 49, including the additional steps of:

using movable components in the portable I/O device, which are controlled by the computer, to convey information output from the computer to an individual via specific controlled movements of the portable I/O device that are visible to the individual; and

associating specific events with specific movements such that when the individual observes a particular movement, information regarding a specific event is provided by the computer to the individual;

whereby the individual can be notified of specific events by the computer based on particular movements of the portable I/O device which are controlled by the computer.

51. (Currently amended) A method, as in claim 49, including the additional steps of:

using an I/O device which has a figure shaped to represent a preselected character or object;

a base unit, removably attached to the figure, and having an integrated computer processor, the integrated computer processor in the base unit further having software to control the movable components in the portable I/O device, the instructions from the computer issued from one or more independent programs through a common interface;

a microphone to input voice data to the integrated computer processor, the microphone electrically attached to either the figure or the base unit;

a speaker to output audio data, the speaker electrically attached to either the figure or the base unit;

the integrated computer processor further having software for synthesizing output audio data from digital data received from the computer or for outputting audio data received from the computer;

the integrated computer processor further having voice recognition software for converting input voice data to digital data for transmission via the wireless link to the computer;

whereby an individual can communicate with one or more independent software programs in a computer using motion output data, output audio data and input voice data, and the processing overhead related to the conversion of input voice data to digital data and synthesis of output audio data is absorbed by the integrated computer processor and not by the computer.

52. (New) A system, as in claim 1, wherein the common interface is an API software interface.

53. (New) A system, as in claim 21, wherein the common interface is an API software interface.

54. (New) A system, as in claim 49, wherein the common interface is an API software interface.

55. (New) A system, as in claim 1, wherein:

the base unit further comprises:

software for controlling the base unit and the movable figure;

a processor, having means to execute the software in the base unit, or to receive and execute software from the computer, or to execute software in the base unit and software received from the computer; and

whereby software in the base unit can control the movable figure independent of direct control of the computer.

56. (New) A system, as in claim 21, wherein:

the base unit further comprises:

software for controlling the base unit and the movable figure;

a processor, having means to execute the software in the base unit, or to receive and execute software from the computer, or to execute software in the base unit and software received from the computer; and

whereby software in the base unit can control the movable figure independent of direct control of the computer.

57. (New) A method, as in claim 35, including the additional steps of:

using the movable figure, when playing a game on a computer, to represent the character from the game, the movable figure directly communicating with a user by motion and/or audio output.

58. (New) A system, as in claim 21, further comprising a speaker for outputting audio data under control of the computer program.

59. (New) A system, as in claim 1, wherein:

the movable figure includes attachment means to attach to the universal adapter in the base unit;

the base unit includes a universal adapter, which attaches to attachment means on the movable figure; and

the attachment means in the movable figure is removably attached to the universal adapter on the base unit such that the base unit can be attached to different movable figures;

whereby the base unit and the movable figures have mutually corresponding and detachable universal adapters which allow different movable figures to be interchangeably used in conjunction with a single base unit.
